Heteroaryl-Aryl Ureas As IGF-1 Receptor Antagonists

BACKGROUND OF THE INVENTION

5 a) Field of the Invention

The present invention relates to methods of treating disease with heteroaryl-aryl ureas which are antagonists of the insulin growth factor-1 receptor. In particular, the invention relates to methods of inhibiting tumor growth and methods of treating cancer.

10

b) Description of Related Art

A major feature of malignant cells is the loss of control over one or more cell cycle elements. These elements range from cell surface receptors to the regulators of transcription and translation (Hunter, *Cell*, 64:249-70(1991); Cantley *et al.*, *Cell*, 64:281-302 (1991); Aaronson, *Science*, 254:1146-51 (1991); Hitwell *et al.*, *Science* 266:1821-8 (1994); Baserga, *Cell*, 79:927-30 (1994)), including the insulin-like growth factors, insulin growth factor-1 (IGF-1) and insulin growth factor-2 (IGF-2). The insulin growth factor system consists of families of ligands, insulin growth factor binding proteins, and receptors. A major physiologic role of the IGF-1 system is the promotion of normal growth and regeneration (Lowe, in *Insulin-Like Growth Factors: Molecular and Cellular Aspects*, LeRoith, D., ed., Boca Raton: CRC Press, 1991:49; Mathews *et al.*, *Endocrinology*, 123:2827-33 (1988); Lynch *et al.*, *J. Clin. Invest.*, 84:640-6 (1989)). The cloning of the insulin growth factor-1 receptor (IGF-1R) (Ullrich *et al.*, *EMBO J.*, 5:2503-12 (1986))
20 allowed for the definitive demonstration that the activation of an overexpressed IGF-1R can initiate mitogenesis (Pietrzkowski *et al.*, *Cell Growth Diff.*, 3:199-205 (1992)) and promote ligand-dependent neoplastic transformation (Kaleko *et al.*, *Mol. Cell Biol.* 10:464-73 (1990)). Furthermore, IGF-1R plays an important role in the establishment and maintenance of the malignant phenotype (*Insulin-Like*

25

Growth Factors: Molecular and Cellular Aspects, LeRoith D, ed., Boca Raton: CRC Press, (1991); Masters *et al.*, *Ann. NY Acad. Sci.*, 692: 89-101 (1993); Humbel, *Eur. J. Biochem.*, 190:445-62 (1990); Sara *et al.*, *Physiol. Rev.* 70:591-614 (1990); Sussenbach, *Prog. Growth Factor Res.*, 1:33-40 (1989); Bondy *et al.*,
5 *Ann. Intern. Med.*, 120:593-602 (1994)).

IGF-1R is synthesized as a single polypeptide chain, which is then glycosylated and cleaved into separate alpha and beta subunits. The receptor exists as a heterodimer, with several disulfide bridges. The ligand-binding domain is located on the extracellular alpha subunit. Approximately one-third of the beta
10 subunit is extracellular and is connected to the intracellular portion by a single transmembrane domain. The tyrosine kinase catalytic site and the ATP binding site are located on the cytoplasmic portion of the beta subunit.

Unlike the epidermal growth factor (EGF) receptor, no mutant oncogenic forms of the IGF-1R have been identified. However, several oncogenes have been
15 demonstrated to affect IGF-1 and IGF-1R expression (Ullrich *et al.*, *EMBO J.*, 5:2503-12 (1986)). It has been shown that cells with disrupted IGF-1R genes will not grow in serum-free medium supplemented with growth factors. In addition, these cells cannot be transformed by transfection with SV40T antigen or ras, agents that efficiently transform corresponding wild-type cells (Sell *et al.*, *Mol.*
20 *Cell Biol.*, 14:3604-12 (1994); Sell *et al.*, *Proc. Natl Acad. Sci. USA*, 90:11217-21 (1993)).

The correlation between a reduction of IGF-1R expression and resistance to transformation has been seen in several other systems, as well. Prager *et al.* inhibited the growth and transformation of rat-I fibroblasts by introduction of a
25 dominant negative mutant of the IGF-1R (Prager *et al.*, *Proc. Natl. Acad. Sci. USA.*, 91:2181-5 (1994)). Others have used an antisense strategy to reduce production of IGF-1R. Exposure of cells to the mRNA antisense to IGF-1R RNA, prevents soft agar growth of several human tumor cell lines (Resnicoff *et al.*, *Cancer Res.*, 55:2463-9 (1995); Resnicoff *et al.*, *Lab. Invest.*, 69:756-60 (1993);

Resnicoff *et al.*, *Cancer Res.*, 54:4848-50 (1994); Shapiro *et al.*, *J Clin. Invest.*, 94:1235-42 (1994)).

It is now established that a major mode of tumor survival is escape from apoptosis (Fisher, *Cell*, 78:539-42 (1994)). IGF-1R abrogates progression into apoptosis, both *in vivo* and *in vitro* (Kulik *et al.*, *Mol. Cell. Bio.*, 17: 1595-1606 (1997); Lamm *et al.*, *Cancer Res.*, 58:801(1998)). It has also been shown that a decrease in the level of IGF-1R below wild-type levels causes apoptosis of tumor cells *in vivo* (Resnicoff *et al.*, *Cancer Res.*, 55:2463-2469 (1995); Resnicoff *et al.*, *Cancer Res.*, 55:3739-3741 (1995)). The ability of IGF-1R disruption to cause apoptosis appears to be diminished in normal, non-tumorigenic cells (Barega, *Trends Biotechnol.*, 14:150-2 (1996)).

Hence, the ligand-activated IGF-1R appears to have at least three important functions. First, it is required for optimal growth, although some growth occurs even in its absence. Second, IGF-1R is obligatory for the establishment and maintenance of the transformed phenotype and for tumorigenesis for several types of cells. Finally, it also appears to protect cells from apoptosis. These features make IGF-1R an attractive target for therapeutic interventions against abnormal growth.

To date, there are few reports of compounds that are selective IGF-1 receptor antagonists. Parrizas *et al.* described tyrphostins that had some efficacy *in vitro* and *in vivo* (Parrizas *et al.*, *Endocrinology*, 138:1427-33 (1997)). These compounds were of modest potency and selectivity over the insulin receptor.

Another family of compounds, heteroaryl-aryl ureas, are ubiquitous in the literature. They have a long history of biological applications. Recently, a number of heteroaryl-aryl ureas have been described as 5HT_{2c} receptor antagonists as treatments for CNS disorders (WO 94/18170; WO 95/01976; WO 94/22871; WO 94/04533; WO 94/14801; WO 93/18028). In addition, they have been reported as ligands for the benzodiazepine receptor (Shindo *et al.*, *Heterocycles*, 1989, 29, 899), inhibitors to fat metabolism (DE 29284485), anti-

inflammatories (EP 123146), pesticides (JP 04178362) and some derivatives as anti-microbials (Patel *et al.*, *J. Inst. Chem.*(India), 1989, 61, 93). As such, several reports to the preparation of these compounds, both on solid phase and in solution have been reported (Buckman *et al.*, *Tet. Lett.*, 1996, 37, 4439; Stewart *et al.*, *J.*
 5 *Med. Chem.*, 1970, 13, 762)

SUMMARY OF THE INVENTION

10 The invention relates to the use of heteroaryl-aryl urea compounds which have been found to be antagonists of the IGF-1 receptor. These compounds, or salts thereof, are suitable for the treatment of essentially any mammalian disease condition in which the IGF-1 receptor plays an active role, and where suppressing the activity of IGF-1R ameliorates the disease condition. The generic formula of
 15 the heteroaryl-aryl urea compounds useful in the present invention is as follows:

Formula I

wherein

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower alkyl,
 20 hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio,
 lower alkynyl, halo, -C(O)NR₇R₈, -COOR₉, -NR₁₀R₁₁, a
 heterocyclic residue, aryl, aralkyl, cyano or nitro, any two adjacent
 substituents R₁-R₅ optionally together forming a lower
 alkylenedioxy,

R₆ is a heterocyclic residue,

R₇, R₈, R₉ are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, aralkyl, or a heterocyclic residue,

R₁₀, R₁₁ are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic residue, and

R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a heterocyclic residue.

In one embodiment, R₆ is quinolinyl, optionally substituted.

One embodiment of the invention provides for a method of inhibiting the activity of the insulin-like growth factor-1 receptor in a mammalian cell. This method comprises administering an effective amount of a compound of formula I to the mammalian cell.

Another embodiment of the invention provides for a method of inhibiting the growth of a cell in a mammal. This method involves administering a compound of formula I to the cell in an amount sufficient to inhibit the growth of the cell.

Still another embodiment of the invention provides for a method of promoting apoptosis in a tumor cell, or more specifically, inhibiting the ability of a mammalian cell to escape from apoptosis. In this method, a compound of formula I is administered to the tumor cell in an amount sufficient to promote apoptosis.

The present invention also provides for a method of using a heteroaryl-aryl urea compound for the treatment of cancer. A method for treating cancer in a mammal is provided where a compound of formula I is administered to the mammal in a therapeutically effective, substantially non-toxic amount.

It is further contemplated by the present invention that the heteroaryl-aryl urea compounds of formula I may be used to inhibit an abnormal growth in a mammal. This method requires that a compound of formula I be administered to

the abnormal growth of the mammal in a therapeutically effective, substantially non-toxic amount.

In a still further embodiment of the invention, a compound of formula I is used to treat an IGF-1R-related condition in a mammal by inhibiting the activity of IGF-1R in a tissue of the mammal. This method comprises administering a compound of formula I to the tissue of the mammal in a therapeutically effective amount.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows the effect of N-(2-methoxy-3-chlorophenyl)-N'-(2-methyl-4-quinoliny)l urea (compound 5, see Example 2) on IGF-1 stimulated growth in MCF-10 cells (Fig. 1a) and MCF-7 cells (Fig. 1b).

Figure 2 shows the effect of N-(2-methoxy-3-chlorophenyl)-N'-(2-methyl-4-quinoliny)l urea (compound 5, see Example 2) on IGF-1 stimulated cell proliferation.

DETAILED DESCRIPTION OF THE INVENTION

The invention relates to the use of heteroaryl-aryl urea compounds which have been found to be antagonists of the IGF-1 receptor. The generic formula of the heteroaryl-aryl urea compounds useful in the present invention is as follows:

Formula I

wherein

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower alkyl,
 5 hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio,
 lower alkynyl, halo, -C(O)NR₇R₈, -COOR₉, -NR₁₀R₁₁, a
 heterocyclic residue, aryl, aralkyl, cyano or nitro, any two adjacent
 substituents R₁-R₅ optionally together forming a lower
 alkylenedioxy,

10 R₆ is a heterocyclic residue,

R₇, R₈, R₉ are, independently, hydrogen, lower alkyl, substituted lower
 alkyl, aryl, aralkyl, or a heterocyclic residue,

R₁₀, R₁₁ are, independently, hydrogen, lower alkyl, substituted lower
 alkyl, aryl, lower acyl, aralkyl, or a heterocyclic residue, and

15 R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a
 heterocyclic residue.

As used herein, "lower alkyl" refers to C₁₋₁₀ alkyl groups which may be
 linear, branched, or cyclic. The term lower alkyl includes such moieties as
 methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl, cyclopentyl,
 20 or cyclohexyl, and those moieties which are positional isomers of these moieties.
 C₁₋₆ lower alkyls are preferred.

"Substituted lower alkyl" refers to a lower alkyl group substituted with
 hydroxyl, aryl, lower alkoxy, lower acyl, amido, amino, nitro, cyano, halo and the
 like.

“Lower alkenyl” refers to any branched or unbranched unsaturated C₂₋₁₀ group having the number of carbon atoms specified, or up to 22 carbon atoms if no limitation on the number of carbon atoms is specified; and having 1 or more double bonds in the group. Lower alkenyl is exemplified by ethenyl, propenyl, butenyl, pentenyl, hexenyl, heptenyl, octenyl, nonenyl, and decenyl, in their various isomeric forms, where the unsaturated bond(s) can be located anywhere in the group.

“Lower alkynyl” refers to hydrocarbon radicals of the scope of lower alkenyl, but having 1 or more triple bonds in the group.

“Lower alkoxy” refers to a lower alkyloxy group.

“Aryl” refers to an aromatic moiety of C₆₋₂₀, preferably C₆₋₁₆, having a single ring (e.g., phenyl), or two or more condensed rings, preferably 2 to 3 condensed rings (e.g., naphthyl), or two or more aromatic rings, preferably 2 to 3 aromatic rings, which are linked by a single bond (e.g., biphenyl). The aryl moiety may optionally be mono, di, or tri substituted, independently, with lower branched or straight chain alkyl, lower cycloalkyl with 3 to 12 carbon atoms, lower branched or straight chain alkoxy, lower cycloalkoxy with 3 to 12 carbon atoms, fluoro, chloro, bromo, trifluoromethyl, cyano, nitro and/or difluoromethoxy.

The term “heterocyclic residue”, as used herein, includes heteroaryl and partially or completely hydrogenated heteroaryl. Typically, the heterocyclic residue contains from 2 to 12 carbon atoms with at least 1, preferably 1 to 3 heteroatoms, in its ring system. Typically, the heterocyclic residue will be a single heteroaryl ring, such as pyridyl, furyl, thienyl or isoxazolyl, or a ring system with two rings, preferably two condensed rings, such as quinolinyl, isoquinolinyl, benzofuranyl, benzofurazanyl, indolinyl, or a partially or completely hydrogenated heterocyclic residue derived from these heteroaryl residues. Alternative heterocyclic residues include indazolyl and tetrahydroquinolinyl. The heterocyclic residue may have from one to four (preferably, not more than three)

substituents, such as lower alkyl, substituted lower alkyl, lower alkoxy, halo, lower acyl, cyano, lower alkenyl, lower alkylthio, lower alkynyl, -C(O)NR₇R₈, -COOR₉, -NR₁₀R₁₁, a heterocyclic residue, aryl, aralkyl, nitro or the like. Any two adjacent substituents on the heterocyclic residue may optionally together form
5 a lower alkylenedioxy.

"Aralkyl" refers to a C₇₋₁₁ group containing a lower alkyl group to which is attached an aryl group such as benzyl, phenethyl, 3-phenylpropyl, or the like.

Certain compounds of formula I may contain one or more asymmetric centers resulting in multiple stereoisomers. In such case, all stereoisomers also
10 fall within this scope.

In one embodiment of the invention, R₆ is selected from the group consisting of a quinolinyl, isoquinolinyl, thiazolyl, and acridinyl. In a preferred embodiment, R₆ is a quinolinyl or thiazolyl.

In one embodiment, R₆ is a heterocyclic residue that has from one to three
15 substituents selected from the group consisting of lower alkyl, substituted lower alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio, lower alkynyl, halo, C(O)NR₇R₈, COOR₉, NR₁₀R₁₁, a heterocyclic residue, aryl, aralkyl, cyano or nitro.

In one embodiment of the invention, at least two of the substituents R₁-R₅
20 are hydrogen. In a preferred embodiment, at least three of the substituents R₁-R₅ are hydrogen. In a further preferred embodiment, three to four of the substituents R₁-R₅ are hydrogen. In a further preferred embodiment, R₆ is 2-methyl-4-quinolinyl, R₁ is methoxy, R₂ is chloro, and R₃-R₅ are hydrogen.

In one embodiment of the invention, the heteroaryl-aryl urea is selected
25 from the group consisting of

N-(3-chloro-4-methylphenyl)-N'-(2-methyl-4-quinolinyl) urea,

N-(2-methoxyphenyl)-N'-(2-methyl-4-quinolinyl) urea,

N-(3-chlorophenyl)-N'-(2-methyl-4-quinolinyl) urea,

N-(3,5-dichlorophenyl)-N'-(2-methyl-4-quinolinyl) urea,

N-(2-methoxy-3-chlorophenyl)-N'-(2-methyl-4-quinoliny)l urea,
N-(4-ethylphenyl)-N'-(2-methyl-4-quinoliny)l urea,
N-(2-methoxy-5-chlorophenyl)-N'-(2-methyl-4-quinoliny)l urea,
N-(3-chloro-4-methylphenyl)-N'-(3-quinoliny)l urea,
5 N-(4-ethylphenyl)-N'-(8-quinoliny)l urea,
N-(3-chlorophenyl)-N'-(3-quinoliny)l urea,
N-(2-methoxy-3-chlorophenyl)-N'-(1,3-thiazol-2-yl) urea,
N-(3-chloro-4-methylphenyl)-N'-(1,3-thiazol-2-yl) urea,
N-(2-methoxyphenyl)-N'-(1,3-thiazol-2-yl) urea, and
10 N-(3,5-dichlorophenyl)-N'-(1,3-thiazol-2-yl) urea.

Pharmaceutically acceptable salts and anions of the compounds of formula I are suitable for use in the methods of the present invention. A "pharmaceutically acceptable salt" may be any salt derived from an inorganic or organic acid. The term "pharmaceutically acceptable anion" refers to the anion of such acid addition
15 salts. The salt and/or the anion are chosen not to be biologically or otherwise undesirable.

Typically the parent compound is treated with an excess of an alkaline reagent, such as hydroxide, carbonate or alkoxide, containing the appropriate cation. Cations such as Na^+ , K^+ , Ca^{2+} and NH_4^+ are examples of cations present
20 in pharmaceutically acceptable salts. Salts may also be prepared using organic bases, such as diethanolamine, ethanolamine, triethanolamine, diethanolamine, *N*-methylglucamine, ethanolamine, and triethanolamine. If the compounds of formula I contain a basic group, an acid addition salt may be prepared. Acid addition salts of the compounds are prepared in a standard manner in a suitable
25 solvent from the parent compound and an excess of acid, such as hydrochloric acid, hydrobromic acid, sulfuric acid (giving the sulfate and bisulfate salts), nitric acid, phosphoric acid and the like, and organic acids such as acetic acid, propionic acid, glycolic acid, pyruvic acid, oxalic acid, malic acid, malonic acid, succinic acid, maleic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, cinnamic

acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, salicylic acid, p toluene-sulfonic acid, hexanoic acid, heptanoic acid, cyclopentanepropionic acid, lactic acid, o-(4-hydroxy-benzoyl)benzoic acid, 1,2-ethanedisulfonic acid, 2-hydroxyethanesulfonic acid, benzenesulfonic acid, p-chlorobenzenesulfonic acid, 5 2-naphthalenesulfonic acid, camphorsulfonic acid, 4-methyl-bicyclo[2.2.2.]oct-2-ene-1-carboxylic acid, glucoheptonic acid, 4,4'-methylenebis(3-hydroxy-2-naphthoic)acid, 3-phenylpropionic acid, trimethyl-acetic acid, t-butylacetic acid, laurylsulfuric acid, glucuronic acid, glutamic acid, 3-hydroxy-2-naphthoic acid, stearic acid, muconic acid and the like. Certain of the compounds form inner salts
10 or zwitterions, which may also be acceptable.

The ability of heteroaryl-aryl ureas of formula I to act as antagonists of IFG-1R is demonstrated in the specific examples listed below (Examples 3-5). In Example 3, data are presented which show that various different heteroaryl-aryl ureas of formula I possess the ability to inhibit the phosphorylation of a substrate
15 peptide by the cytoplasmic kinase domain of IGF-1R. In Example 4 and Figure 1, a heteroaryl-aryl urea compound of formula I, N-(2-methoxy-3-chlorophenyl)[(2-methyl(4-quinoliny))amino]carboxamide, is shown to inhibit IGF-1 stimulated cell growth. Similarly, Example 5 and Figure 2 show that the same heteroaryl-aryl urea compound of formula I can inhibit IGF-1 stimulated cell proliferation.
20 The IFG-1R antagonist activity of the heteroaryl-aryl urea compounds of formula I makes them suitable for use in the methods of the present invention.

In one embodiment of the invention, a method is provided for inhibiting the activity of the insulin-like growth factor-1 receptor in a mammalian cell. This method comprises administering an effective compound of formula I to the
25 mammalian cell.

In an alternative embodiment of the invention, a method is provided for inhibiting the growth of a mammalian cell, and preferably a cell which is in a mammal. This method involves administering a compound of formula I to the cell in an amount sufficient to inhibit growth of the cell. If the targeted mammalian

cell resides within a mammal, then the administration of the compound of formula I occurs without unacceptable toxic effects on the host mammal.

In a preferred embodiment, the cell is a tumor cell. The targetted tumor may optionally be in the brain, lung, liver, spleen, kidney, bladder, lymph node, 5 small intestine, pancreas, colon, stomach, breast, endometrium, prostate, testicle, vulva, cervix, ovary, skin, head and neck, esophagus, or bone marrow. In a preferred embodiment, the cell is a tumor cell of the prostate or breast.

The heteroaryl-aryl ureas of formula I may also be used to promote apoptosis in a mammalian cell or to inhibit the escape of a cell from apoptosis. In 10 such uses, a compound of formula I is administered to the cell in a sufficient quantity to achieve the desired effect.

The IFG-1R antagonist activity of the heteroaryl-aryl urea compounds of formula I also makes them suitable for use in the treatment of any IGF-1R-related disorders. In a preferred embodiment the heteroaryl-aryl urea compounds are used 15 to treat cancer. The treatment of cancer includes, but is not limited, to the following effects: killing tumor cells, inhibiting tumor growth, inhibiting metastasis, decreasing tumor sized, reversing or reducing the malignant phenotype of tumor cells, and inducing an immune response directed towards tumor cells, or combinations thereof. The present invention provides for a method for treating 20 cancer in a mammal comprises administering to the mammal a therapeutically effective amount of a compound of formula I. In a particularly preferred embodiment, the mammal is a human.

The cancer which is treated may optionally be a cancer selected from the group consisting of cancers of the brain, lung, liver, spleen, kidney, bladder, 25 lymph node, small intestine, pancreas, colon, stomach, breast, endometrium, prostate, testicle, vulva, cervix, ovary, skin, head and neck, esophagus, bone marrow, or blood. In a preferred method, cancer of the prostate or breast is treated. Although in some cases it may be desirable to treat cancer in a mammal

systemically, in most cases it will be preferable to target a cell which is either a tumor cell, a cell within a tumor, or a cell near a tumor.

The method of treating cancer in a mammal may optionally further comprise treating the mammal with an additional form of therapy for cancer. This additional form of therapy for cancer is preferably selected from an established form of therapy well-known to one of ordinary skill in the art. The additional form of therapy may include, but is not limited to, chemotherapy (including multi-drug resistance therapy), external beam radiation therapy, brachytherapy, gene therapy, and surgery.

To treat cancer, a compound of formula I may be combined with compositions comprising other agents effective in the treatment of cancer. These compositions would be provided in a combined amount effective to kill or inhibit proliferation of the cell. This process may involve introducing the heteroaryl-aryl urea and the additional agent(s) or factor(s) into the cell at the same time. This may be achieved by contacting the cell with a single composition or pharmaceutical formulation that includes both agents, or by exposing the cell to two distinct compositions or formulations, at the same time, wherein one composition includes the heteroaryl-aryl urea and the other includes the agent.

Alternatively, the heteroaryl-aryl urea treatment may precede or follow the other agent treatment by intervals ranging from minutes to weeks. In embodiments where the additional agent and the heteroaryl-aryl urea are applied separately to the mammalian cell, one would generally ensure that a significant period of time did not expire between the time of each delivery, such that the second agent and the heteroaryl-aryl urea would still be able to exert an advantageously combined effect on the cell. In such instances, it is contemplated that one would contact the cell with both modalities within about 12-24 hours of each other and, more preferably, within about 6-12 hours of each other, with a delay time of only about 12 hours being most preferred. In some situations, it may be desirable to extend the time period for treatment significantly, however, where

several days (2, 3, 4, 5, 6 or 7) to several weeks (1, 2, 3, 4, 5, 6, 7 or 8) lapse between the respective administrations. In summary, the compounds of the invention may be used for simultaneous, separate, or sequential use in the therapy of cancer, in combination with other forms of cancer treatment.

5 It also is conceivable that more than one administration of the heteroaryl-aryl urea or the other agent will be desired. Various combinations may be employed, where the heteroaryl-aryl urea of formula I is "A" and the other agent is "B", as exemplified below:

A/B/A B/A/B B/B/A A/A/B B/A/A A/B/B B/B/B/A B/B/A/B
10 A/A/B/B A/B/A/B A/B/B/A B/B/A/A B/A/B/A B/A/A/B B/B/B/A
A/A/A/B B/A/A/A A/B/A/A A/A/B/A A/B/B/B B/A/B/B B/B/A/B

Other combinations are contemplated. Again, to achieve cell killing, both agents are delivered to a cell in a combined amount effective to kill the cell.

Agents or factors suitable for use in a combined therapy include any
15 chemical compound or treatment method that induces DNA damage when applied to a cell. Such agents and factors include radiation and waves that induce DNA damage such as, γ irradiation, X-rays, UV-irradiation, microwaves, electronic emissions, and the like.

In one embodiment of the invention, the radiation therapy which is
20 combined with the administration of a heteroaryl-aryl urea composition constitutes external beam radiation. The external beam radiation treatment typically delivers high-energy radiation, such as high-energy x-ray beams. Alternatively, internal radiation, or brachytherapy, may be used in combination with the heteroaryl-aryl urea therapy. Methods of delivering brachytherapy include intracavitary or
25 interstitial placement of radiation sources, instillation of colloidal solutions, and parenteral or oral administration. Sealed sources are encapsulated in a metal, wire, tube, needle, or the like. Unsealed radioactive sources are prepared in a suspension or solution.

A variety of chemical compounds, also described as "chemotherapeutic agents," function to induce DNA damage, all of which are intended to be of use in the combined treatment methods disclosed herein. Chemotherapeutic agents contemplated to be of use, include, e.g., adriamycin, 5-fluorouracil (5FU), etoposide (VP-16), camptothecin, actinomycin-D, mitomycin C, cisplatin (CDDP) and even hydrogen peroxide. The invention also encompasses the use of a combination of one or more DNA damaging agents, whether radiation-based or actual compounds, such as the use of X-rays with cisplatin or the use of cisplatin with etoposide.

For example, in treating cancer according to the invention, one would contact the tumor cells with an agent in addition to the heteroaryl-aryl urea of formula I. This treatment may be in combination with irradiation of the tumor with radiation such as X-rays, UV-light, gamma-rays or even microwaves. Alternatively, the tumor cells may be contacted with the agent by administering to the subject a therapeutically effective amount of a pharmaceutical composition comprising a compound such as, adriamycin, 5-fluorouracil, etoposide, camptothecin, actinomycin-D, mitomycin C, or more preferably, cisplatin. The agent may be prepared and used as a combined therapeutic composition, or kit, by combining it with a heteroaryl-aryl urea of formula I, as described above.

Agents that directly cross-link nucleic acids, specifically DNA, are envisaged to facilitate DNA damage leading to a synergistic, antineoplastic combination with the expression constructs of the present invention. Agents such as cisplatin, and other DNA alkylating agents may be used. Cisplatin is not absorbed orally and must therefore be delivered via injection intravenously, subcutaneously, intratumorally or intraperitoneally.

Agents that damage DNA also include compounds that interfere with DNA replication, mitosis and chromosomal segregation. Such chemotherapeutic compounds include adriamycin (also known as doxorubicin), etoposide, podophyllotoxin, and the like. Widely used in a clinical setting for the treatment

of neoplasms, these compounds are administered through bolus injections intravenously at doses ranging from 25-75 mg/m² at 21 day intervals for adriamycin, to 100 mg/m² for etoposide intravenously or double the intravenous dose orally.

5 Agents that disrupt the synthesis and fidelity of nucleic acid precursors and subunits also lead to DNA damage. As such a number of nucleic acid precursors have been developed. Particularly useful are agents that have undergone extensive testing and are readily available. As such, agents such as 5-fluorouracil (5-FU), are preferentially used by neoplastic tissue, making this agent particularly useful
10 for targeting to neoplastic cells. Although quite toxic, 5-FU, is applicable in a wide range of carriers, including topical, however intravenous administration with doses ranging from 450-1000 mg/m²/day being commonly used.

Other factors that cause DNA damage and have been used extensively include what are commonly known as γ -rays, X-rays, and/or the directed delivery
15 of radioisotopes to tumor cells. Other forms of DNA damaging factors are also contemplated such as microwaves and UV-irradiation. It is most likely that all of these factors effect a broad range of damage on DNA, on the precursors of DNA, on the replication and repair of DNA, and on the assembly and maintenance of chromosomes. Dosage ranges for X-rays range from daily doses of 50 to 200
20 roentgens for prolonged periods of time (3 to 4 weeks), to single doses of 2000 to 6000 roentgens. Dosage ranges for radioisotopes vary widely, and depend on the half-life of the isotope, the strength and type of radiation emitted, and the uptake by the neoplastic cells.

The regional delivery of the heteroaryl-aryl urea compounds of formula I to
25 patients with cancer is a preferred method for delivering a therapeutically effective gene to counteract the clinical disease being treated. Similarly, the chemo- or radiotherapy may be directed to a particular, affected region of the subject's body. Alternatively, systemic delivery of the heteroaryl-aryl urea compound of formula I

and/or the agent may be appropriate in certain circumstances, for example, where extensive metastasis has occurred.

In an alternative embodiment of the invention, a therapeutically effective, substantially non-toxic amount of a compound of formula I is administered to an abnormal growth in a method for treating the abnormal growth in a mammal, preferably a human. In still another embodiment, a therapeutically effective amount and substantially non-toxic amount of a heteroaryl-aryl urea of formula I is administered to a tissue in a mammal, preferably a human, in a method for treating an IGF-1R-related condition in a mammal. Any IGF-1R-related disease condition may be treated in this manner as long as activity by the insulin-like growth factor-1 receptor plays a role in the disease condition and antagonism of the receptor leads to the amelioration of at least one undesirable symptom or indication of the disease condition.

The compounds of formula I are thus used to antagonize the IGF-1R in patients which require such treatment. The method of treatment comprises the administration parenterally, and orally, of an effective quantity of the chosen compound, preferably dispersed in a pharmaceutical carrier appropriate for the intended application. Generally this will entail preparing a pharmaceutical compositions that is essentially free of pyrogens, as well as any other impurities that could be harmful to humans or animals. One also will generally desire to employ appropriate salts and buffers to render the complex stable and allow for complex uptake by target cells.

A "therapeutically effective amount" of compound I is defined herein as the amount required to achieve the desired positive effect with respect to the particular IGF-1R-related disease condition being treated whether it be cancer or another disease condition. The effective amount will be determined in part based on the intended goal, for example, (i) inhibition of tumor cell proliferation versus (ii) elimination or killing of tumor cells.

Dosage units of the active ingredient are generally selected from the range

of 0.01 to 1000 mg/kg , but will be readily determined by one skilled in the art depending upon the route of administration, age and condition of the patient. In one embodiment, the dosage unit is selected from the range of 1 to 1000 mg/kg. These dosage units may be administered one to ten times daily for acute or chronic
5 disease. No unacceptable toxicological effects are expected when compounds of the invention are administered in accordance with the present invention.

Pharmaceutical compositions of the compounds of formula I, or derivatives thereof, may be formulated as solutions, crystalline, amorphous or lyophilized powders for parenteral administration. Powders may be reconstituted by addition
10 of a suitable diluent or other pharmaceutically acceptable carrier prior to use. The liquid formulation is generally a buffered, isotonic, aqueous solution. Examples of suitable diluents are normal isotonic saline solution, standard 5% dextrose in water or buffered sodium or ammonium acetate solution. Such formulation is especially suitable for parenteral administration, but may also be used for oral
15 administration. It may be desirable to add excipients such as polyvinylpyrrolidinone, gelatin, hydroxycellulose, acacia, polyethylene glycol, mannitol, sodium chloride or sodium citrate. Alternatively, these compounds may be encapsulated, tableted or prepared in an emulsion or syrup for oral administration. Pharmaceutically acceptable solid or liquid carriers may be added
20 to enhance or stabilize the composition, or to facilitate preparation of the composition. Liquid carriers include syrup, peanut oil, soybean oil, olive oil, glycerin, saline, alcohols and water. Solid carriers include starch, lactose, calcium sulfate, dihydrate, terra alba, magnesium stearate or stearic acid, talc, pectin, acacia, agar or gelatin. The carrier may also include a sustained release material
25 such as glycerol monostearate or glyceryl distearate, alone or with a wax. The amount of solid carrier varies but, preferably, will be between about 20 mg to about 1 g per dosage unit. The pharmaceutical preparations are made following the conventional techniques of pharmacy involving milling, mixing, granulation, and compressing, when necessary, for tablet forms; or milling, mixing and filling

for hard gelatin capsule forms. When a liquid carrier is used, the preparation will be in the form of syrup, elixir, emulsion or an aqueous or non-aqueous suspension. Such a liquid formulation may be administered directly p.o. or filled into a soft gelatin capsule.

5 The invention compounds may be administered by any route suitable to the subject being treated and the nature of the subject's condition. Alternative routes of administration include administration by injection, including intravenous, intraperitoneal, intramuscular, and subcutaneous injection, by transmucosal or transdermal delivery, through topical applications, nasal spray, suppository and
10 the like or may be administered orally. For application against tumors, direct intratumoral injection, injection of a resected tumor bed, regional (*e.g.* lymphatic) or systemic administration is contemplated. It also may be desired to perform continuous perfusion over hours or days via a catheter to a disease site like a tumor or tumor site. Suitable formulations for each of these methods of
15 administration may be found, for example, in *Remington's Pharmaceutical Sciences*, latest edition, Mack Publishing Company, Easton, PA.

EXAMPLES

20

The Examples that follow serve to illustrate this invention. The Examples are intended to in no way limit the scope of this invention, but are provided to show how to make and use the compounds of this invention.

The compounds of this invention are known compounds which can be
25 prepared by conventional methods of organic chemistry. In some cases, protective groups may be introduced and finally removed. Suitable protective groups for amino, hydroxyl, carboxyl groups are described in Greene *et al.*, *Protective Groups in Organic Synthesis*, Second Edition, John Wiley and Sons, New York, 1991. A number of different procedures for preparing isocyanates can be found in

Larock, *Comprehensive Organic Transformations*, VCH Publishers, New York, 1989.

Since heteroaryl-aryl ureas are common compounds, methods of preparing heteroaryl-aryl ureas are well known to one of ordinary skill in the art. For instance, examples of preparations of heteroaryl-aryl ureas useful in the present invention can be found in the PCT Publication WO 94/18170, herein incorporated by reference. Known methods of preparing these types of compounds can be found in Chapter 6 in *Organic Functional Group Preparations Vol 12-II*, Sandler, Karo ed., Academic Press, New York, 1971, Buckman *et al.*, *Tet. Lett.* 1996, 37:4439, and Stewart *et al.*, *J. Med. Chem.*, 1970, 13:762, all of which are herein incorporated by reference.

Example 1. Preparation of N-(3-chloro-4-methylphenyl)-N'-(2-methyl-4-quinoliny) urea, compound 1

The reaction scheme for the preparation of N-(3-chloro-4-methylphenyl)[(2-methyl(4-quinoliny))amino]carboxamide, 1 is shown below:

To a solution of 4-quinolinylamine (1 mmol) in CH₂Cl₂ at room temperature was added slowly 3-Chloro-4-methylbenzenisocyanate (1.1 mmol). The reaction was allowed to stir for 2 h, and precipitation occurred. The reaction mixture was filtered and a white solid collected. This was recrystallized from hexane/EtOAc to afford white crystals.

Example 2. Preparation of additional heteroaryl-aryl ureas.

The compounds shown in Table 1, below, were prepared using procedures similar to those shown in Example 1, above.

5

14	H	Cl	H	Cl	H	1,3-thiazol-2-yl

Example 3. IGF-1R Substrate Assay.

Nunc Maxisorp plates were coated with 100 μ L 10 μ g/mL-streptavidin at 4°C overnight or for 2 hr at 25 – 37°C. The plates were washed in 20 mM Tris pH7.6, 150 mM NaCl, 0.05% Tween 20, 0.8 mM Na₃VO₄, and 0.04% Biocide between all steps of the assay. The plates were blocked in 200 μ L 50 mM
5 Hepes/150 mM NaCl/0.1% Triton-X 100 overnight at 4°C or for 2 hr at 25 – 37°C.

Aliquots of the IGF-1R-cytoplasmic kinase domain (IGF-1R-CKD; amino acids 959-1367 of IGF-1R) were purified and stored at – 80°C until use. KS2 (GPWLEEEEEAYGWMDF; SEQ ID NO:1), gastrin (1-17) that is a substrate for
10 many tyrosine kinases including the insulin receptor, was synthesized as a biotin conjugate (KS2-biotin) (Baldwin *et al.*, *Nature*, 301:435-37 (1983)). The assay mixture consisted of 0.2 μ g/mL IGF-1R-CKD (concentration adjusted for optimal response), 300 – 900 nM KS2-biotin (depending on optimal response), 2 mM MnCl₂, 5 mM MgCl₂ (4 – 10 mM MnCl₂ can be substituted), compounds to be
15 tested (50 μ M) or their vehicle, and 50 μ M ATP. The start of phosphorylation begins with the addition of ATP. Incubation was continued for 10 – 30 minutes, at which time, the reaction was stopped through the quenching the metals with 20 mM EDTA (final concentration).

The reaction was diluted 1:10 in buffer A (2 mM HEPES pH 7.6, 0.05%
20 Triton X-100, 0.05% bovine serum albumin (BSA)) and 100 μ L was captured onto washed, coated and blocked, streptavidin Nunc Maxisorp plate, overnight at 4°C or 2 hr at 37°C. Anti-phosphotyrosine antibody (12.5 ng/well) conjugated to horseradish peroxidase (RC20:HRPO by Transduction Laboratories) was diluted into 0.5X Buffer B (25 mM Hepes pH7.6, 75 mM NaCl, 0.025% Tween 20, 2 mM
25 Na₃VO₄+ 1% BSA) and incubated for 1.5 to 2 hr at 25°C. The phosphorylated substrate was measured by developing the plate with 100 μ L 3', 3', 5, 5' tetramethylbenzidine (TMB), and quantified using a plate reader.

The phosphorylation of KS2 by IGF-1R-CKD was found to be inhibited by

heteroaryl-aryl urea compounds of Examples 1 and 2. The results are shown below in Table 2.

TABLE 2

5 Inhibition of KS2 phosphorylation by the IGF-1R CKD in the presence of heteroaryl-aryl ureas.

Compound	% Inhibition
5	21
7	23
8	65
9	33
10	26

12	21
13	20
14	17

Example 4. Cell growth inhibition study by protein assay.

10 100,000 cells (MCF-7) were plated into 24 well dishes, and grown in complete Dulbecco's modified Eagle's medium (DMEM) supplemented with 10% fetal calf serum (FCS) for 24 h. Cells were washed twice in serum-free DMEM, then 0.5 ml DMEM supplemented with 0.5% FCS and 1nM IGF-1 was added with or without a heteroaryl-aryl compound, compound 5, and in the presence or
15 absence of 1nM hormone (IGF-1 or insulin, respectively). After 48 h at 37°C, cells were washed twice with phosphate buffered saline (PBS), then solubilized in 0.03% sodium dodecyl sulfate (SDS). Protein was determined using the BCA Protein Assay reagent from Pierce Chemical with BSA serving as a standard.

MCF-10 cells were plated as above in DMEM/ Ham's F12 medium (DMEM/F12) supplemented with 5% horse serum, 8ng/ml epidermal growth factor (EGF), 0.5µg/ml hydrocortisone, 0.1µg/mL cholera toxin. After 24hr, cells were washed twice in serum-free DMEM/F12, then 0.5 ml DMEM/F12 with 0.5% horse serum added with or without test compound, and in the presence or absence of 1nM IGF-I.

The results of the protein assay are shown in Figure 1a and 1b. Addition of the heteroaryl-aryl urea test compound, compound 5, was found to inhibit IGF-1 stimulated cell growth.

Example 5. Cell Proliferation Assay.

5000 cells (MCF-7 or MCF-10) were plated into 96 well plates and grown for 24 h as in Example 4, above. Cells were washed in serum free DMEM, then 100 µl media and 1 nM IGF-1 were added to wells in the presence of or absence of compound 5 (see Example 2) and hormone. After 48 h, viability was determined by CellTiter 96™ (Promega). This kit is a chromogenic bioassay procedure for the measurement of cell proliferation. Briefly, 20 µl (3-[4,5,dimethylthiazol-2-yl]-5-[3-carboxymethoxyphenyl]-2-[4-sulfophenyl]-2H-tetrazolium, inner salt (MTS) was added to each well and incubation was continued for 3-4 h. Viable cells reduced the MTS to formazan, which was then measured at 492 nm using an ELISA plate reader. Cell proliferation was calculated based on the increase in the number of viable cells.

The results of the cell proliferation assay are shown in Figure 2. The data show that the addition of the heteroaryl-aryl urea test compound, compound 5, led to a decrease in IGF-1R stimulated cell proliferation.

Example 6. Oral pharmaceutical composition preparation - solid dosage formulation.

A pharmaceutical composition for oral administration may be prepared by combining the following:

	<u>% w/w</u>
Compound of formula I	10%
5 Magnesium stearate	0.5%
Starch	2.0%
HPM cellulose	1.0%
Microcrystalline cellulose	86.5%

The mixture may be compressed to tablets, or filled into hard gelatin capsules.

The tablet may be coated by applying a suspension of film former (e.g. HPM cellulose), pigment (e.g. titanium dioxide) and plasticiser (e.g. diethyl phthalate) and drying the film by evaporation of the solvent. The film coat can comprise 2.0% to 6.0% of the tablet weight, preferably about 3.0%.

Example 7. Oral pharmaceutical composition preparation - capsule.

A pharmaceutical composition of a compound of formula I suitable for oral administration may also be prepared by combining the following:

	<u>% w/w</u>
20 Compound of formula I	20%
Polyethylene glycol	80%

The medicinal compound is dispersed or dissolved in the liquid carrier, with a thickening agent added, if required. The formulation is then enclosed in a soft gelatin capsule by suitable technology.

Example 8. Pharmaceutical composition for parenteral administration.

A pharmaceutical composition for parenteral administration may be prepared by combining the following:

	<u>Preferred Level</u>
Compound of formula I	1.0%
Saline	99.0%

The solution is sterilized and sealed in sterile containers.

5

All documents cited in the above specification are herein incorporated by reference. Various modifications and variations of the present invention will be apparent to those skilled in the art without departing from the scope and spirit of the invention. Although the invention has been described in connection with specific preferred embodiments, it should be understood that the invention as
10 claimed should not be unduly limited to such specific embodiments. Indeed, various modifications of the described modes for carrying out the invention which are obvious to those skilled in the art are intended to be within the scope of the following claims.

What we claim is:

1. A method for inhibiting the activity of the insulin-like growth factor-1 receptor in a mammal, comprising:
 - 5 administering to said mammal an effective amount of a compound of the formula

10 as a single stereoisomer or as a mixture thereof, or the pharmaceutically acceptable salts thereof, wherein

R_1 - R_5 are, independently, hydrogen, lower alkyl, substituted lower alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio, lower alkynyl, halo, $-C(O)NR_7R_8$, $-COOR_9$,
 15 $-NR_{10}R_{11}$, a heterocyclic residue, aryl, aralkyl, cyano or nitro, any two adjacent substituents R_1 - R_5 optionally together forming a lower alkylenedioxy group,

R_6 is a heterocyclic residue,

R_7 , R_8 , R_9 are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, aralkyl, or a heterocyclic residue,

20 R_{10} , R_{11} are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic residue, and

R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a heterocyclic residue.

2. A method for inhibiting the growth of a cell in a mammal, comprising:
 5 administering to said mammal an effective amount of a compound of the formula

as a single stereoisomer or as a mixture thereof, or the pharmaceutically acceptable salts thereof, wherein

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio, lower alkynyl, halo, -C(O)NR₇R₈, -COOR₉, -NR₁₀R₁₁, a heterocyclic residue, aryl, aralkyl, cyano or
 15 nitro, any two adjacent substituents R₁-R₅ optionally together forming a lower alkylenedioxy group,

R₆ is a heterocyclic residue,

R₇, R₈, R₉ are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, aralkyl, or a heterocyclic residue,

R₁₀, R₁₁ are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic residue, and

R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a heterocyclic residue.

3. A method for promoting apoptosis of a tumor cell in a mammal, comprising:

administering to said mammal an effective amount of a compound of the formula

as a single stereoisomer or as a mixture thereof, or the pharmaceutically acceptable salts thereof, wherein

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio, lower alkynyl, halo, -C(O)NR₇R₈, -COOR₉, -NR₁₀R₁₁, a heterocyclic residue, aryl, aralkyl, cyano or nitro, any two adjacent substituents R₁-R₅ optionally together forming a lower alkylenedioxy group,

R₆ is a heterocyclic residue,

R₇, R₈, R₉ are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, aralkyl, or a heterocyclic residue,

R₁₀, R₁₁ are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic residue, and

R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a heterocyclic residue.

4. A method for treating cancer in a mammal, comprising:

administering to said mammal a therapeutically effective,
substantially non-toxic amount of a compound of the formula

as a single stereoisomer or as a mixture thereof , or the
pharmaceutically acceptable salts thereof, wherein

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower
alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl,
lower alkylthio, lower alkynyl, halo, -C(O)NR₇R₈, -COOR₉,
-NR₁₀R₁₁, a heterocyclic residue, aryl, aralkyl, cyano or
nitro, any two adjacent substituents R₁-R₅ optionally
together forming a lower alkylenedioxy group,

R₆ is a heterocyclic residue,

R₇, R₈, R₉ are, independently, hydrogen, lower alkyl, substituted
lower alkyl, aryl, aralkyl, or a heterocyclic residue, and

R₁₀, R₁₁ are, independently, hydrogen, lower alkyl, substituted
lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic
residue; and

R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a
heterocyclic residue.

5. A method for treating an abnormal growth in a mammal, comprising:

administering to said mammal a therapeutically effective,
substantially non-toxic amount of a compound of the formula

as a single stereoisomer or as a mixture thereof , or the
pharmaceutically acceptable salts thereof, wherein:

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower
alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl,
lower alkylthio, lower alkynyl, halo, -C(O)NR₇R₈, -COOR₉,
-NR₁₀R₁₁, a heterocyclic residue, aryl, aralkyl, cyano or
nitro, any two adjacent substituents R₁-R₅ optionally
together forming a lower alkylenedioxy group,

R₆ is a heterocyclic residue,

R₇, R₈, R₉ are, independently, hydrogen, lower alkyl, substituted
lower alkyl, aryl, aralkyl, or a heterocyclic residue,

R₁₀, R₁₁ are, independently, hydrogen, lower alkyl, substituted
lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic
residue, and

R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a
heterocyclic residue.

6. A method for treating an IGF-1R-related disease condition in a mammal by
inhibiting the activity of IGF-1R in a tissue of the mammal, comprising:

administering to said mammal a therapeutically effective,
substantially non-toxic amount of a compound of the formula

as a single stereoisomer or as a mixture thereof , or the
pharmaceutically acceptable salts thereof, wherein

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower
alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl,
lower alkylthio, lower alkynyl, halo, -C(O)NR₇R₈, -COOR₉,
-NR₁₀R₁₁, a heterocyclic residue, aryl, aralkyl, cyano or
nitro, any two adjacent substituents R₁-R₅ optionally
together forming a lower alkylenedioxy group,

R₆ is a heterocyclic residue,

R₇, R₈, R₉ are, independently, hydrogen, lower alkyl, substituted
lower alkyl, aryl, aralkyl, or a heterocyclic residue,

R₁₀, R₁₁ are, independently, hydrogen, lower alkyl, substituted
lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic
residue, and

R₇ and R₈ or R₁₀ and R₁₁ together with the nitrogen may form a
heterocyclic residue.

7. The method of any one of claims 1-6, wherein three to four of the substituents R₁-R₅ are hydrogen.
8. The method of claim 7, wherein R₆ is selected from the group consisting of quinolinyl and thiazolyl.
9. The method of Claim 8, wherein R₆ is selected from the group consisting of 3-quinolinyl, 4-quinolinyl, 8-quinolinyl, and thiazol-2-yl.
10. The method of claim 9, wherein said compound is selected from the group consisting of
- N-(3-chloro-4-methylphenyl)-N'-(2-methyl-4-quinolinyl) urea,
 - N-(2-methoxyphenyl)-N'-(2-methyl-4-quinolinyl) urea,
 - N-(3-chlorophenyl)-N'-(2-methyl-4-quinolinyl) urea,
 - N-(3,5-dichlorophenyl)-N'-(2-methyl-4-quinolinyl) urea,
 - N-(2-methoxy-3-chlorophenyl)-N'-(2-methyl-4-quinolinyl) urea,
 - N-(4-ethylphenyl)-N'-(2-methyl-4-quinolinyl) urea,
 - N-(2-methoxy-5-chlorophenyl)-N'-(2-methyl-4-quinolinyl) urea,
 - N-(3-chloro-4-methylphenyl)-N'-(3-quinolinyl) urea,
 - N-(4-ethylphenyl)-N'-(8-quinolinyl) urea,
 - N-(3-chlorophenyl)-N'-(3-quinolinyl) urea,
 - N-(2-methoxy-3-chlorophenyl)-N'-(1,3-thiazol-2-yl) urea,
 - N-(3-chloro-4-methylphenyl)-N'-(1,3-thiazol-2-yl) urea,
 - N-(2-methoxyphenyl)-N'-(1,3-thiazol-2-yl) urea, and
 - N-(3,5-dichlorophenyl)-N'-(1,3-thiazol-2-yl) urea,
- or a pharmaceutically acceptable salt thereof.
11. The method of claim 2, wherein said cell is a tumor cell.

12. The method of claim 4, wherein said mammal is a human.
13. The method of any one of claims 4 or 12, further comprising treating said mammal with an additional form of therapy for cancer selected from the group consisting of chemotherapy, external beam radiation therapy, brachytherapy, gene therapy, and surgery.
14. The method of any one of claims 4, 12, or 13, wherein said cancer is prostate cancer or breast cancer.
15. A compound of the formula:

as a single stereoisomer or as a mixture thereof, or the pharmaceutically acceptable salts thereof, wherein R₁ is H or alkoxy of 1-4 C atoms, R₂ is H or halogen, R₃ is H or alkyl of 1-4 C atoms, R₄ is H or halogen, R₅ is H, and R₆ is an optionally alkyl-substituted heteroaryl, with the proviso that in a compound wherein R₁ is H, R₂ is Cl, R₃ is methyl, R₄ is H, and R₅ is H, R₆ cannot be 2-methyl-4-quinolyl, and that in a compound wherein R₁ is methoxy, R₂ is H, R₃ is H, R₄ is H, and R₅ is H, R₆ cannot be 2-methyl-4-quinolyl.

16. The compound of claim 15, wherein three to four of the substituents R₁-R₅ are H.

17. The compound of claim 16,

wherein R₁ is H, R₂ is Cl, R₃ is H, R₄ is H, R₅ is H, and R₆ is 2-methyl-4-quinoliny, namely N-(3-chlorophenyl)-N'-(2-methyl-4-quinoliny) urea;

or

wherein R₁ is H, R₂ is Cl, R₃ is H, R₄ is Cl, R₅ is H, and R₆ is 2-methyl-4-quinoliny, namely N-(3,5-dichlorophenyl)-N'-(2-methyl-4-quinoliny) urea;

or

wherein R₁ is methoxy, R₂ is Cl, R₃ is H, R₄ is H, R₅ is H, and R₆ is 2-methyl-4-quinoliny, namely N-(2-methoxy-3-chlorophenyl)-N'-(2-methyl-4-quinoliny) urea;

or

wherein R₁ is H, R₂ is H, R₃ is ethyl, R₄ is H, R₅ is H, and R₆ is 2-methyl-4-quinoliny, namely N-(4-ethylphenyl)-N'-(2-methyl-4-quinoliny) urea;

or

wherein R₁ is methoxy, R₂ is H, R₃ is H, R₄ is Cl, R₅ is H, and R₆ is 2-methyl-4-quinoliny, namely N-(2-methoxy-5-chlorophenyl)-N'-(2-methyl-4-quinoliny) urea;

or

wherein R₁ is H, R₂ is Cl, R₃ is methyl, R₄ is H, R₅ is H, and R₆ is 3-quinoliny, namely N-(3-chloro-4-methylphenyl)-N'-(3-quinoliny) urea;

or

wherein R₁ is H, R₂ is H, R₃ is ethyl, R₄ is H, R₅ is H, and R₆ is 8-quinoliny, namely N-(4-ethylphenyl)-N'-(8-quinoliny) urea;

or

wherein R₁ is H, R₂ is Cl, R₃ is H, R₄ is H, R₅ is H, and R₆ is 3-quinolinyl, namely N-(3-chlorophenyl)-N'-(3-quinolinyl) urea;

or

wherein R₁ is methoxy, R₂ is Cl, R₃ is H, R₄ is H, R₅ is H, and R₆ is 1,3-thiazol-2-yl, namely N-(2-methoxy-3-chlorophenyl)-N'-(1,3-thiazol-2-yl) urea;

or

wherein R₁ is H, R₂ is Cl, R₃ is methyl, R₄ is H, R₅ is H, and R₆ is 1,3-thiazol-2-yl, namely N-(3-chloro-4-methylphenyl)-N'-(1,3-thiazol-2-yl) urea;

or

wherein R₁ is methoxy, R₂ is H, R₃ is H, R₄ is H, R₅ is H, and R₆ is 1,3-thiazol-2-yl, namely N-(2-methoxyphenyl)-N'-(1,3-thiazol-2-yl) urea;

or

wherein R₁ is H, R₂ is Cl, R₃ is H, R₄ is Cl, R₅ is H, and R₆ is 1,3-thiazol-2-yl, namely N-(3,5-dichlorophenyl)-N'-(1,3-thiazol-2-yl) urea.

18. A pharmaceutical composition comprising a therapeutically effective amount of a compound of the formula:

as a single stereoisomer or as a mixture thereof, or the pharmaceutically acceptable salts thereof, wherein

R₁-R₅ are, independently, hydrogen, lower alkyl, substituted lower alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio, lower

alkynyl, halo, $-C(O)NR_7R_8$, $-COOR_9$, $-NR_{10}R_{11}$, a heterocyclic residue, aryl, aralkyl, cyano or nitro, any two adjacent substituents R_1 - R_5 optionally together forming a lower alkylenedioxy group,

R_6 is a heterocyclic residue,

R_7 , R_8 , R_9 are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, aralkyl, or a heterocyclic residue,

R_{10} , R_{11} are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl, lower acyl, aralkyl, or a heterocyclic residue, and

R_7 and R_8 or R_{10} and R_{11} together with the nitrogen may form a heterocyclic residue,

and at least one pharmaceutically acceptable excipient.

19. A pharmaceutical composition comprising a therapeutically effective amount of a compound of any one of claims 15-17 and at least one pharmaceutically acceptable excipient.

20. The use of a compound of the formula:

as a single stereoisomer or as a mixture thereof, or the pharmaceutically acceptable salts thereof, wherein

R_1 - R_5 are, independently, hydrogen, lower alkyl, substituted lower alkyl, hydroxyl, lower alkoxy, lower acyl, lower alkenyl, lower alkylthio, lower

alkynyl, halo, -C(O)NR₇R₈, -COOR₉, -NR₁₀R₁₁, a heterocyclic residue,
 aryl, aralkyl, cyano or nitro, any two adjacent substituents R₁-R₅
 optionally together forming a lower alkylendioxy group, R₆ is a
 heterocyclic residue, R₇, R₈, R₉ are, independently, hydrogen, lower alkyl,
 5 substituted lower alkyl, aryl, aralkyl, or a heterocyclic residue, R₁₀, R₁₁
 are, independently, hydrogen, lower alkyl, substituted lower alkyl, aryl,
 lower acyl, aralkyl, or a heterocyclic residue, and R₇ and R₈ or R₁₀ and
 R₁₁ together with the nitrogen may form a heterocyclic residue, in the
 preparation of a medicament for the treatment of an IGF-1R- or cell
 10 growth-related disorder, or for the treatment of cancer.

21. The use of a compound of any one of claims 15-17 in the preparation of
 a medicament for the treatment of an IGF-1R- or cell growth-related
 disorder, or for the treatment of cancer.

22. A process for the preparation of a compound of any one of claims 15-
 17, said process comprising:
 (a) reacting a compound of the formula

, wherein R₁-R₅ are as defined in one of said claims,
 with H₂N-R₆, wherein R₆ is as defined in one of said claims, to yield a
 compound of the formula

; or

(b) reacting the free base of a compound any one of claims 15-17 with an
acid to give a pharmaceutically acceptable addition salt; or

(c) reacting an acid addition salt of a compound of any one of claims 15-17
with a base to form the corresponding free base;

(d) converting an acid addition salt of a compound any one of claims 15-17
to another pharmaceutically acceptable acid addition salt of a compound of
any one of claims 15-17; or

(e) resolving a racemic mixture or mixture of any proportions of a
compound of any one of claims 15-17 to yield a stereoisomer thereof.

INTERNATIONAL SEARCH REPORT

Int. Application No

PCT/US 99/30300

A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 A61K31/47 A61K31/425 A61P35/00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	SUGIYAMA Y., ET AL.: "TMP-153, a novel ACAT inhibitor, inhibits cholesterol absorption and lowers plasma cholesterol in rats and hamsters" ATHEROSCLEROSIS, vol. 113, no. 1, 1995, pages 71-78, XP000886209 abstract Materials and Methods Discussion	1-9, 15, 16, 18-21

☒ Further documents are listed in the continuation of box C.☒ Patent family members are listed in annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 99/30300

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 1-14 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/ compositions.
2. ☒ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

In referring to the inhibition of IGF-1R or IGF-1R-related diseases, present claims 1, 6, 20 and 21 relate to an extremely large number of possible medical indications which are not clearly defined.

Thus, a lack of clarity within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search has been carried out for those parts of the application which do appear to be clear, namely the use of the claimed compounds in the treatment of cancer (cf. description, p.1, lines 6-9; p.12, lines 12-22).

The search of claims 2 and 3 has been similarly limited to inhibiting the growth of a cell or promoting cell apoptosis as relates to the treatment of cancer.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
